

Cybersecurity & Web Skills Inventory

1. Educational Transition & Foundations

- **Academic Shift:** Successfully transitioned from a Pre-Medical background into Computer Science and Cybersecurity, dedicating the last 2 years to understanding core concepts.
- **Web Development (Front-End):** Spent the first 6 months building front-end projects using **HTML, CSS, and Bootstrap**. Currently able to analyze code structural logic, though syntax requires a refresher due to a gap in active coding.
- **Python Programming:** Watched 20+ hours of foundational Python tutorials. Understands basic coding structures but requires practical script-writing practice.
- **Cybersecurity Foundations:** Completed the **Google Cybersecurity Professional Certificate** (consisting of 8 structural courses). Possesses a strong conceptual understanding of defensive security, offensive security, and the role of AI in cyberspace.

2. Technical Skills & Tools Assessment (0-100%)

Web Development & Automation

- **HTML & CSS: 55%** (Can read, structure, and style basic layouts; utilizes AI tools to add animation and professional components).
- **Bootstrap Framework: 50%** (Familiar with utility classes and responsive grids to optimize development time).
- **Python: 10%** (Understands core syntax and logic, but cannot write custom automation scripts or exploits independently yet).

Operating Systems & Networking

- **Linux (Kali Linux): 50%** (Comfortable with day-to-day operations, file manipulation, and navigational commands like ls, cd, grep, chmod etc.... Advanced scripting and configuration require external assistance).
- **Network Security: 75% (Theoretical) | 30% (Practical)** (Strong grasp of TCP/IP, UDP, and core routing protocols. Familiar with Wireshark GUI for traffic analysis).

- **Nmap: 80%** (Highly confident in running network scans, interpreting command outputs, and identifying open ports or running services).

Web Application Security & Interception

- **DVWA (Damn Vulnerable Web Application):** Completed practical testing exclusively on **Low Security settings** for SQL Injection, XSS, and Open Redirects.
- **Burp Suite: 15%** (Understands the core purpose and functionality of proxy interception. However, faced local system/browser configuration issues in Firefox, resulting in **0 live requests intercepted manually**).

3. Bug Hunting Execution & "The AI Dependency Gap"

Critical Gap Analysis: There is an 80-90% conceptual clarity on major vulnerabilities (SQLi, XSS, IDOR, CSRF, BAC, SSRF) through reading resources like *Real-World Bug Hunting* and *Web Application Hacking*. However, the execution phase relies completely on AI tools.

- **Payload Generation: 0% Independent** (Unable to manually construct advanced bypass payloads. Relies fully on AI prompts to write payloads for modern web application firewalls).
- **Reconnaissance & Enumeration: 15%** (Understands the massive importance of mapping a target. Uses basic Google Dorking manually, but runs command-line tools like **Subfinder** or directory busters entirely via AI-generated commands).

4. Live Target Track Record & Practical Experience

Despite technical constraints, successfully applied knowledge to live targets:

- **University of Sahiwal:** Identified and manually verified **3 vulnerabilities** on the official website and reported them directly to the administration.
- **HackerOne (Bykea Program):** Discovered and reported an **API Information Disclosure** vulnerability. The report was formally closed as *Informative*.
- **Vulnerability Submissions:** Submitted low-level vulnerabilities on other platforms (including *HackenProof*), which were closed due to being out-of-scope or minor.

5. Strategic Roadmap & Dedicated Targets

Immediate Career Strategy (Next 6 Months)

- **Focus: 100% Web2 Web Application Security.** Will not jump into complex environments prematurely. Will focus on simple, accessible bug bounty programs on HackerOne to build a solid baseline.
- **Core Goal:** Eliminate the AI dependency by learning to write manual payloads, configuring Burp Suite properly, and handling command-line recon tools without assistance.
- **Future Pivot:** Gradual transition into **Web3, Blockchain, and Smart Contract Auditing (Solidity)** once Web2 foundations are completely concrete.

Time Commitment & Work Ethic

- **Availability: 6 Hours per Day | 6 Days a week (36 hours weekly).**
- **Execution Window:** Peak focus hours from **5:00 AM to 12:00 PM** to ensure maximum mental energy and zero distractions.
